The best way is to modify quicktables script (most probably, it is rc.firewall in your virtual servers). Just add `venet' in list of the recognized devices.

Something like this:

```
--- /usr/local/sbin/rc.firewall.ovz      2003-09-02 08:04:54.000000000 +0400
+++ /usr/local/sbin/rc.firewall  2006-12-06 12:08:45.000000000 +0300
