Hi,

I am running Centos 4.4 x64 and I thought I would try out to get OpenVZ running on this Opteron box, so I installed via YUM the latest stable kernel (2.6.9-023stab032.1-smp).

I modified the grub config and attempted to boot and I got the following error message:

Error 13: Invalid executable or unsupported format ???

Here is what I have in Grub:

```
title OpenVZ (2.6.9 x64 SMP)
    root (hd0,0)
    kernel /vmlinuz-2.6.9-023stab032.1-smp ro root=/dev/Linux/CentOS console=tty1
console=ttyS1,9600
    initrd /initrd-2.6.9-023stab032.1-smp.img
    boot
```

Any ideas? My main setup uses RAID 0 with LVM on top. My boot partition though is a standard ext3 100Mo partition on the sda.

Thank you for your guidance!

Sébastien
