`vzctl destroy VEID` should completely remove VE-related files, so, the followed `vzctl create VEID --ostemplate ...` should be equal to the creation of new one. I'm wonder, how is it possible to have issues in the first case and don't have them in the second.

So, I recommend you to destroy erroneous VE and check, do you have it's ID somewhere in /proc/mounts, /proc/user_beancounters or on the filesystem.
