Hi,

First, copy your asterisk software to the HN, fire it up and try to receive the call. This will isolate whether the problem is a problem due to the environment being virtualized.

Are you reliant on the ztdummy/zaptel kernel modules? If so, you will need to grant each VE access:

for x in `ls /dev/zap`; do /usr/sbin/vzctl set VEID --devnodes zap/\${x}:rw --save; done

OpenVZ Forum

Hope this helps or points you in the right direction.

Rick
