Hello. I have a question with my VPS. I create a fedora-core-4-i386-default VPS with OpenVZ. When I do a ping-pong test, I found my VPS only can create 16 thread at most. So I view my VID.conf and edit PRIVVMPAGES="49152:53575" to PRIVVMPAGES="991520:1035750", then I found I still only can create 45 thread. But I think there is enough mem in my computer...

Attached my ping-pong test source code

Could anyone help me? Thanks!
