OK, I see now. When you said:
"When I try to connect to ssh on the host node"
You meant using ssh from the HN to the VE. Metrics numfiles, kmemsize, privvmpages exhaustion would all explain why any software malfunctions in a VE. To verify:

```
cat /proc/user_beancounters
```

and paste here. All you need to do is raise the limits for the failcnt'ing metrics, understand how much resources your applications need and give them more than that. Have you read the UBC page in the wiki?

Rick
