Subject: Installing BIND on VE's
Posted by Al Sparks on Fri, 22 Dec 2006 02:19:25 GMT

I'm trying to set up a test environment of name servers. I downloaded the BIND tarball to one of the Virtual Environment, and tried to compile it. That didn't work, because there's no gcc installed.

So I tried compiling it at the management level which did work, and transferred the compiled version over to the VE. When I did a make install make did run, but ended with errors.

How do I create a VE that will compile and install something like BIND? I'm sure there are lots of libraries that may be needed.

I'm new to OpenVZ. Am I missing something obvious?

I'm running CentOS 4.4 in all VE's.
