The VEs send all their traffic to the Hostnode. So by default the VEs can communicate with the HN only. For any other kind of communication you have to enable IP-Forwarding on HN - usually one does this together with Proxyarp.

By doing this the VEs can communicate quite well because the HN does all the routing. So there should be no problem with your plans.

For further information fire up a search-engine and ask for "Pseudobridge with proxyarp". There is a howto somewhere that covers this.

Cheers,
Konstantin
