Hi Pieter-Jan,

perfect, but one question

I wonder why the stable ovzkernel (2.6.9) doesn't start,
the needed modules :

```
CONFIG_BLK_DEV_SD=y  
CONFIG_SCSI_ATA_PIIX=y  
CONFIG_MOUSE_PS2=y
```

are build-in, (so the kernel should boot without a initrd)

CONFIG_BLK_DEV_SR=m (SCSI CDROM)
is build as loadable module in the ovzkernel-config.

Can you please poste what kind of modules have you enabled to start your ovzkernel.
