---

Notice:

In one of the servers we changed the hard disk already -> still the same error.

The systems are using a VIA VT6420 SATA Controller. And I already found some links to other people that have similar problems.

For example this one:

<http://lkml.org/lkml/2006/12/30/79>

They conclude that this is a device error but I still think this is wrong because we have exactly the same error on many machines.

Maybe the driver for VT6420 has an error. I'll try looking deeper into it but I'm not a kernel hacker so my knowledge of the kernel is limited. Hopefully someone can help out.
