Well, here is the list.

1) HyperVM will also work as a control panel for Xen as well as OpenVZ.
2) HyperVM will allow you to move VPS's between OpenVZ and Xen in real time, leaving all of the network connections in place.

3) HyperVM will be supporting Windows on Xen. this will allow for Linux AND Windows VPS to be on the SAME node.

There are many more reasons I have for recommending HyperVm as a control panel. And yes, I have used Virtuozzo also.

I hope this helps you undersatnd my recommendation.
