Hello!

According to

```
# vzquota stat 111
resource      usage      softlimit  hardlimit  grace
1k-blocks     2716712   39000000  39100000
              ^^^^^
```

you set a blocks limit for 111th VE to ~39Gb, and only ~2.7Gb are used in VE. Remember these numbers.

According to

```
#df -a
Filesystem      1K-blocks  Used Available Use% Mounted on
/dev/sda9       95121228 62907700 27381580 70% /vz
              ^^^^  ^^^^^
```

/vz partion is of ~95Gb size and ~63 Gb is used, so ~32Gb is free. Remember these numbers to.

Ok. When you give a df command inside VE, what should it output in this situation? First, consider the total amount of space. Should df output 39Gb? No! VE can't write so much, because there is not enough space on /vz partion.

According to http://wiki.openvz.org/OpenVZ_disk_quota%2C_df_and_stat_weird_behaviour df should output $quota_usage + free_ext2 = 2.7 + 32 = \sim 34\text{Gb}$. This is what we see in your output:

```
# df -a
Filesystem      1K-blocks  Used Available Use% Mounted on
/dev/simfs      34930264 2716712 27381604 10% /
              ^^^^^
```

So your problem is actually formulated in http://wiki.openvz.org/OpenVZ_disk_quota%2C_df_and_stat_weird_behaviour:
"Do not set random disk quota barrier/limit! Even if you want VE to be unlimited, consider reasonable values."

HTH,
Vasily.
