Hello All,

My current setup is OpenVZ>>SolusVM and whmcs. I have things setup for automatic VPS creation. But there is one thingthat is really hurting business and that is not being able to take advantage of multiple disks or at least i do not know how to accomplish this as of yet.

My current server has 4x 2TB drives. I want to create 2 VPS on each of those drives but have not been able to find any information on how to do this.

Any help would be appreciated.

Well, there are more ways to do it. Using openvz itself, you should look at the contents of "/etc/vz/vz.conf" file and at the template files in "/etc/sysconfig/vz-scripts" directory. The paths can also be specified on the command line when using the 'vzctl create' command.

OTOH, since you are using SolusVM and WHMCS you might want to ask their user support if their front-ends have such controls. If they do, it would be better (I'm guessing here) to use them instead.
