Subject: [PATCH v2 0/7] SUNRPC: initial part of making pipefs work in net ns
Posted by Stanislav Kinsbursky on Tue, 08 Nov 2011 11:13:43 GMT
View Forum Message <> Reply to Message

This patch-set was created in context of clone of git branch:
git://git.linux-nfs.org/projects/trondmy/nfs-2.6.git.

v2:
1) Rebased of current repo state (i.e. all commits were pulled before apply)

This patch-set implements pipefs superblock creation per network namespace context instead of using single one for all possible contexts. Also, it provides pipefs dentries creation and destruction helpers for kernel routines.

Additional description of the idea about how to make RPC pipefs work per network namespace context can be found in the letter titled "SUNRPC: "RPC pipefs per network namespace" preparations", which has been sent already to linux-nfs@vger.kernel.org.

The following series consists of:

Stanislav Kinsbursky (7):
      SUNRPC: create RPC pipefs superblock per network namespace context
      SUNRPC: hold current network namespace while pipefs superblock is active
      SUNRPC: send notification events on pipefs sb creation and destruction
      SUNRPC: pipefs dentry lookup helper introduced
      SUNRPC: put pipefs superblock link on network namespace
      SUNRPC: pipefs per-net operations helper introduced
      SUNRPC: added debug messages to RPC pipefs

Subject: [PATCH v2 1/7] SUNRPC: create RPC pipefs superblock per network namespace context
Posted by Stanislav Kinsbursky on Tue, 08 Nov 2011 11:14:41 GMT
View Forum Message <> Reply to Message

This is the initial step of RPC pipefs virtualization. It changes nothing to
current pipefs behaviour except that mount of pipefs in other than init_net
network namespace context will provide only root tree. No other dentries will
be visible.

Subject: [PATCH v2 2/7] SUNRPC: hold current network namespace while pipefs superblock is active

Posted by Stanislav Kinsbursky on Tue, 08 Nov 2011 11:14:43 GMT

View Forum Message <> Reply to Message

We want to be sure that network namespace is still alive while we have pipefs
mounted.
This will be required later, when RPC pipefs will be mounting only from
user-space context.

Subject: [PATCH v2 5/7] SUNRPC: put pipefs superblock link on network namespace
Posted by Stanislav Kinsbursky on Tue, 08 Nov 2011 11:16:12 GMT
View Forum Message <> Reply to Message

We have modules (like, pNFS blocklayout module) which creates pipes on rpc_pipefs. Thus we need per-net operations for them. To make it possible we require appropriate super block. So we have to put sb link on network namespace context. Note, that it's not strongly required to create pipes in per-net operations. IOW, if pipefs wasn't mounted yet, that no sb link reference will present on network namespace and in this case we need just need to pass through pipe creation. Pipe dentry will be created during pipefs mount notification.

Subject: [PATCH v2 3/7] SUNRPC: send notification events on pipefs sb creation and destruction

Posted by Stanislav Kinsbursky on Tue, 08 Nov 2011 11:16:13 GMT

View Forum Message <> Reply to Message

They will be used to notify subscribers about pipefs superblock creation and destruction.
Subcribers will have to create their dentries on passed superblock on mount event and destroy otherwise.

Subject: [PATCH v2 4/7] SUNRPC: pipefs dentry lookup helper introduced
Posted by Stanislav Kinsbursky on Tue, 08 Nov 2011 11:16:15 GMT
View Forum Message <> Reply to Message

In all places, where pipefs dentries are created, only directory inode is
actually required to create new dentry. And all this directories has root
pipefs dentry as their parent. So we actually don't need this pipefs mount
point at all if some pipefs lookup method will be provided.
IOW, all we really need is just superblock and simple lookup method to find
root's child dentry with appropriate name. And this patch introduces this
method.
Note, that no locking implemented in rpc_d_lookup_sb(). So it can be used only
in case of assurance, that pipefs superblock still exist. IOW, we can use this
method only in pipefs mount-umount notification subscribers callbacks.

Subject: [PATCH v2 6/7] SUNRPC: pipefs per-net operations helper introduced

During per-net pipes creation and destruction we have to make sure, that pipefs
sb exists for the whole creation/destruction cycle. This is done by using
special mutex which controls pipefs sb reference on network namespace context.
Helper consists of two parts: first of them (rpc_get_dentry_net) searches for
dentry with specified name and returns with mutex taken on success. When pipe
creation or destructions is completed, caller should release this mutex by
rpc_put_dentry_net call.
