I had a power failure in my home a couple of weeks ago, and ever since, VMs on my OpenVZ machine. I noticed that it would take several seconds to log into VMs. However, I have just deployed Puppet and really noticed large amounts of lag that for the few recipes I have written so far. The puppetmaster What would normally take 1-2 seconds or less in other environs takes anywhere from 30-40 seconds to up to 250 seconds to run a catalog. I suspect that it is making multiple connections, each suffering the lag.

Suggestions on getting the connection times back to normal?

Thanks,
--b

It sounds like you're having DNS resolution failures and the delay you experience is how long it takes for the queries to timeout.

Thanks, Tim! That was exactly what it was. Apparently things didn't come completely back up, and it was falling back to the secondary. (obviously, I haven't written any puppet manifests for dns...:))
