Subject: [PATCH 0/5] NFS: create blocklayout pipe per network namesapce context
Posted by Stanislav Kinsbursky on Tue, 29 Nov 2011 09:17:03 GMT
View Forum Message <> Reply to Message

This patch set was created in context of clone of git
branch: git://git.linux-nfs.org/projects/trondmy/nfs-2.6.git.
tag: v3.1

This patch set depends on previous patch sets titled:
1) "SUNRPC: initial part of making pipefs work in net ns"
2) "SUNPRC: cleanup PipeFS for network-namespace-aware users"
3) "SUNRPC: make RPC clients use network-namespace-aware PipeFS routines"
4) "NFS: create clients and IDMAP pipes per network namespace"

This patch set is the final part of making SUNRPC PipeFS and it's users work in
network namespace context.

The following series consists of:

Stanislav Kinsbursky (5):
    NFS: handle blocklayout pipe PipeFS dentry by network namespace aware routines
    NFS: blocklayout pipe creation per network namespace context introduced
    NFS: blocklayout PipeFS notifier introduced
    NFS: remove RPC PipeFS mount point reference from blocklayout routines
    SUNRPC: kernel PipeFS mount point creation routines removed

View Forum Message <> Reply to Message

Hello, Trond.
This is the final part of SUNRPC PipeFS virtualization.
I hope, that you'll find some time to review all series.

You can clone my working tree to have a look at what will be at the end:

git://github.com/skinsbursky/nfs-per-net-ns.git

BTW, I can provide a simple "sandbox" (a kind of container with it's own network namespace and veth device inside) which I use to test my changes.

--
Best regards,
Stanislav Kinsbursky

Subject: [PATCH 3/5] NFS: blocklayout PipeFS notifier introduced
Posted by Stanislav Kinsbursky on Tue, 29 Nov 2011 09:19:12 GMT
View Forum Message <> Reply to Message

This patch subscribes blocklayout pipes to RPC pipefs notifications. Notifier
is registering on blocklayout module load. This notifier callback is
responsible for creation/destruction of PipeFS blocklayout pipe dentry.
Note that no locking required in notifier callback because PipeFS superblock
pointer is passed as an argument from it's creation or destruction routine and
thus we can be sure about it's validity.

Subject: [PATCH 2/5] NFS: blocklayout pipe creation per network namespace context introduced

Posted by Stanislav Kinsbursky on Tue, 29 Nov 2011 09:19:15 GMT

View Forum Message <> Reply to Message

This patch implements blocklayout pipe creation and registration per each existent network namespace.
This was achived by registering NFS per-net operations, responsible for blocklayout pipe allocation/register and unregister/destruction instead of initialization and destruction of static "bl_device_pipe" pipe (this one was removed).
Note, than pointer to network blocklayout pipe is stored in per-net "nfs_net" structure, because allocating of one more per-net structure for blocklayout module looks redundant.
This patch also changes dev_remove() function prototype (and all it's callers, where it' requied) by adding network namespace pointer parameter, which is used to discover proper blocklayout pipe for rpc_queue_upcall() call.

Subject: [PATCH 4/5] NFS: remove RPC PipeFS mount point reference from blocklayout routines
Posted by Stanislav Kinsbursky on Tue, 29 Nov 2011 09:20:55 GMT
View Forum Message <> Reply to Message

This is a cleanup patch. We don't need this reference anymore, because
blocklayout pipes dentries now creates and destroys in per-net operations and
on PipeFS mount/umount notification.
Note that nfs4blocklayout_register_net() now returns 0 instead of -ENOENT in
case of PipeFS superblock absence. This is ok, because blocklayout pipe dentry
will be created on PipeFS mount event.

Subject: [PATCH 5/5] SUNRPC: kernel PipeFS mount point creation routines removed

Posted by Stanislav Kinsbursky on Tue, 29 Nov 2011 09:20:58 GMT

View Forum Message <> Reply to Message

This patch removes static rpc_mnt variable and its creation and destruction
routines, because they are not used anymore.

When is the "pipefs mount event" going to happen? When inserting kernel modules or when user issues mount command?

Thanks,
Tao

When user issues mount command.
Kernel mounts of PipeFS has been removed with all these patch sets I've sent
already.

Then it is going to break blocklayout user space program blkmapd, which is stared before
mounting any file system and it tries to open the pipe file when started.
Not sure if you implement the same logic on nfs pipe as well. But if you do, then nfs client user
space program idmapd will fail to start for the same reason.

Why not just fail to load module if you fail to initialize pipefs? When is rpc_get_sb_net() going to
fail?

Sorry, but I don't get it. Probably we have misunderstanding here.
You said, that "blkmapd ... tries to open the pipe file when started". This pipe
file is located on PipeFS, isn't it?

If yes, then PipeFS have to be mounted already in user-space. And if it has been mounted - then pipe dentry is present.
IOW, pipe (without dentry) will be created on module load. Pipe dentry will be created right after that (like it was before) if PipeFS was mounted from user-space. If not - then pipe dentry will be created on PipeFS (!) mount (not NFS or pNFS mount) from user-space.

Or I'm missing something in your reply?

> Not sure if you implement the same logic on nfs pipe as well. But if you do, then nfs client user space program idmapd will fail to start for the same reason.
>

The same logic here.

> Why not just fail to load module if you fail to initialize pipefs? When is rpc_get_sb_net() going to fail?
>

Sorry, but I don't understand, what is your idea. And why do we need to fail at all.
BTW, rpc_get_sb_net() just checks, was PipeFS mounted in passed net, or not. If not - not a problem. Dentries will be created on mount event. If yes, then it returns locked PipeFS sb and the next step is dentry creation.

Why on earth is blkmapd doing this instead of listening for file creation notifications like the other rpc_pipefs daemons do?

Trond

Sorry, I misunderstood. I was thinking about mounting NFS or pNFS when
you say "when user issues mount command". Thanks for the explanation.

Not sure how the original implementer chose this but I think it is
likely because we do not expect the pipe file to be created or deleted
dynamically.

Unless blkmapd can pin the sunrpc module (which it shouldn't be able to)
then that assumption would be wrong. Please look into fixing blkmapd...

Sorry, I don't quite get it. Do you mean sunrpc module may be removed
while nfs/blocklayout modules are still in use? Please explain it a
bit. Thanks.

I mean that I'm perfectly entitled to do

'modprobe -r blocklayoutdriver'

and when I do that, then I expect blkmapd to close the rpc pipe and wait
for a new one to be created just like rpc.idmapd and rpc.gssd do when I
remove the nfs and sunrpc modules.

The rpc pipefs mount doesn't hold a reference on the sunrpc module?

--b.

I stand corrected: the mount does hold a reference to the sunrpc
module.

However nothing holds a reference to the blocklayoutdriver module, so
the main point that the "blocklayout" pipe can disappear from underneath
the blkmapd stands.

OK, that makes sense.

Thanks for the explanation and I agree it can cause problem if user
reload blocklayout module. I will look into a fix to blkmapd.

Best,
Tao

These patches need rebasing in order to apply on top of 3.2-rc7...

Cheers
  Trond

OK. Further testing seems to indicate that we're going to have to
postpone merging these patches until the 3.4 merge window.

The problems are twofold:

As the patches stand now in the linux-next tree, they can (and
occasionally do) Oops on unmount. The reason was that I rejected the
PipeFS notifier patch for the idmapper (due to the reported problem of
nfs_idmap_init/nfs_idmap_quit being undefined when CONFIG_NFS_V4 is
undefined), and the fact that it is missing causes the unmount at the
end of our tests to hit the BUG() in fs/dcache.c:905. This suggests that
we will have the same problem with the pNFS block layout driver, since I
still haven't received a rebased update of the 5 'create blocklayout
pipe per network namesapce context' patches.

The second problem that was highlighted was the fact that as they stand
today, these patchsets do not allow for bisection. When we hit the Oops,

I had Bryan try to bisect where the problem arose. He ended up pointing at the patch "SUNRPC: handle RPC client pipefs dentries by network namespace aware routine", which is indeed the cause, but which is one of the _dependencies_ for all the PipeFS notifier patches that fix the problem.

Hello, Trond.
I've resend the patch set (rebased with fix for nfs_idmap_init/nfs_idmap_quit).

I'm confused here. Does this means, that I have to fix patch "SUNRPC: handle RPC client pipefs dentries by network namespace aware routine" to make it able to

bisect?

What I mean is that currently, I have various ways to Oops the kernel when I apply "SUNRPC: handle RPC client pipefs dentries by network namespace aware routine" before all these other followup patches are applied.

One way to could fix this, might be to add dummy versions of rpc_pipefs_notifier_register()/unregister() so that "NFS: idmap PipeFS notifier introduced" and the other such patches can be applied without compilation errors or Oopses before the "handle RPC client pipefs dentries..." patch is applied. The latter could then enable the real rpc_pipefs_notifier_register()/....

The point is to not have these patches add _known_ bugs to the kernel at any point, so that someone who is trying to track down an unknown bug via "git bisect" doesn't have to also cope with these avoidable issues...

Ok, thanks for explanation.
I've sent rebased "v2" of the patch set, contains updated patch "SUNRPC: handle RPC client pipefs dentries by network namespace aware routine", which, I believe, fixes oops, spotted by Bryan (it was caused by excessive call of

rpc_put_mount() on PipeFS dentries unlink).
So, if I'm not mistaken here, there's no need in implementing of dummy versions
of rpc_pipefs_notifier_(un)register() or any other dummy stuff.

BTW, it looks like that in last 2 days I've sent all updates to the issues you
pointed out. If not, please, ping me once more.

OK. Fair enough. We'll give it some testing to make sure that we don't
hit it again...

I'm in the process of reviewing it right now.

Cheers
  Trond

You might want to consider converting to call_usermodehelper()

I know that it greatly simplified our code both in Kernel and
in user-mode. And it made nfs-utils maintainer much happier
as well.

The speed is not Cardinal here I think. Like in objects it's
done once per new device_id
