Hello,

I just installed clean minimal debian and installed openvz with 2.6.32-5-openvz-686. I basically followed instructions from one of the web sites - can't post links yet, but there are plenty and they seem to be all exactly the same.

After installing and setting up sysctl.conf I reboot and get:

Loading Linux 2.6.32-5-openvz-686 ...

Loading initial ramdisk ...

and then the PC reboots again. Any idea what can be causing this issue ? I can still boot with the original kernel.

System is debian-6.0.3-i686.

Kind Regards,
Konrad
