Subject: [PATCH 2/3] make clone_children a flag
Posted by Glauber Costa on Sun, 11 Dec 2011 14:45:37 GMT

View Forum Message <> Reply to Message

There is no reason to have a flags field, and then a separate
bool field just to indicate if the clone_children flag is set.
Make it a flag

Doesn't this change how remount conditions are checked?

Thanks.

Right. Currently we can do this:

```
 # mount -t cgroup xxx /mnt
 # mount -o remount,clone_children /mnt
```

with this patch, the above remount will fail.

But..the current bevaiour of remount is a bit confusing in that remount
with/without "clone_children" has no effect on anything:

```
 # mount -t cgroup -o clone_children xxx /mnt
 # cat /mnt/cgroup.clone_children
 1
 # mount -o remount xxx /mnt
 # mount | grep cgroup
 xxx on /mnt type cgroup (rw,clone_children)
 # cat /mnt/cgroup.clone_children
 1
```

Well, I was thinking it wouldn't, because I patched all callers. But I
forget life is not always that simple: After you mentioned, I checked
and we do test for changes in the flag field explicitly on remount. So I
missed that, indeed.

That's indeed confusing, and it comes from the fact that we always
inherit clone_children from the parent - which is sane, IMHO. So this
flag only has any value in establishing the initial behaviour of the top
root cgroup. I wonder then if it wouldn't better to just be explicit and
fail in this case ?

I don't think all current behaviors are sane and if not let's change
them, but those things have to be explicit with proper description and

rationale.

Thanks.

140 % agree to that. As I said, I wrongly believed it to be functionally
equivalent when I sent it, but missed the flags remount check.

If you believe the behavior we now get is saner, I can rewrite the
Changelog and resend it.
