Subject: OpenVAS Within Container
Posted by mindcruft on Thu, 22 Dec 2011 21:22:15 GMT

I am running OpenVAS within a container and am unable to run scans. It seems to not get passed the host discovery part. I thought perhaps it was restricted to the capabilities so I have enabled all available capabilities for the container with still no luck. I am also running the container with the unlimited profile and I also checked user_beancounters. I am not hitting any limits. Any ideas on what else I could check or why this is not working? I am stuck at the moment. I am running on Debian with 2.6.32-5-openvz-686 kernel and running vzctl version 3.0.24.
