hi

i had the following virtual server running properly

/var/lib/vz/private# ls
101 102 103 104 105 106 107 108 109

today the 102 server stopped working.when i looked into the 102 it contains only the following files

  /var/lib/vz/private/102# ls
    proc sys var

then i created a new virtual server 109 it contains the following file

/var/lib/vz/private/109# ls
bin boot dev etc fastboot home lib lib64 media mnt opt proc root sbin selinux srv sys
tmp usr var

and i don't no what happened. when i tried to start the server 102 it gives me following error

/var/lib/vz/private/109# vzctl start 102
  Starting container ...
  Container is mounted
  Unable to open /var/lib/vz/root/102/sbin/init-logger: No such file or directory
  Unable to copy init-logger
  Not enough resources to start environment
  Container start failed (try to check kernel messages, e.g."dmesg | tail")
  Container is unmounted

I need to take backup of data in the virtual server 102 what can i do now...

    any help is appreciated

Are you useing pve / proxmox, seems that the init-logger binary isnt copy to your container (ct).

Please check your running ct's, esp. dir /sbin/init-logger.

Bye,
 Thorsten

hi

the 102 server was working fine till today .....when i looked in the private directory for the 102 it is showing only the following

/var/lib/vz/private/102# ls
proc sys var

there is no sbin directory... that is my problem
