Not sure what this means when I enter into a VE.

vzctl enter 144

entered into CT 144

2012-01-13T18:47:50-0800 vzctl : CT 144 : Open /dev/pts/0

[root@listdata /]# 2012-01-13T18:47:50-0800 vzctl : CT 144 : Open /dev/pts/0

-bash: 2012-01-13T18:47:50-0800: command not found

Everything still works. I think it started with latest 2 upgrades to vzctl.

Yes all mine are doing the same, I also have one that shows:

	total	used	free	shared	buffers	cached
Mem:	24048	23082	965	0	2515	10861
-/+ buffers/cache:		9706	14342			
Swap:	10236	0	10236			

Which is completely wrong, as there container only has 2GB of memory. Its showing what the actual node shows.

In regards to the memory issue, I saw someone else saying they have the same issue when enabling vzswap. I do not have it enabled however I enabled it then disabled it and the memory now displays correctly.

	total	used	free	shared	buffers	cached
Mem:	4096	718	3377	0	0	0
-/+ buffers/cache:		718	3377			
Swap:	0	0	0
