Centos 6.2 is no longer bootable. At boot time I get a kernel panic. The instructions for remote console don't work for Centos 6 since none of the files referenced exist.

I took a picture of the screen, <http://fdcga.com/images/panic.jpg>

If someone would please update the instructions on how to get a netconsole working.

Specifically in the "Setting from initrd" section there is no `/etc/sysconfig/mkinitrd` directory and `/etc/modprobe.conf` doesn't exist.

I no longer have serial ports so that's not an option.

The stock kernel still boots OK.

Thanks,
Jim.
