New to openvz, still low on the learning curve, so apologies if this is a stupid question.

I'm running proxmox VE 2.0 beta. I'll be using RHEL5 or some variant in openvz containers. Can vmware-workstation be installed and run in such a container ?

Thanks!

No, that is not possible. VMWare need to compile some kernel modules. OpenVZ gives not the permission to his containers to change hardware kernel modules.

This is not completely correct.

As far as I remember I managed to run virtualbox inside a container.

As long the software accesses all its functions through device files, these nodes can be imported into a container. The most critical stuff (according to my experience) is everything network-related (e.g. bridging)

Regards
divB

We are talking here about VMWare, not Virtualbox.

Still, if you have control over the hardware node and the actual kernel, it might be possible. Same as VirtualBox.
