---

Hi All,

I am attempting to setup an SSH based gateway with which our customers can control their containers through.

Heres how its setup:

- 1) user logs in with publickey
- 2) user is dropped to bash script with options for management using sudo

When a user attempts to use my script, i receive the following error:

Sorry, user test is not allowed to execute '/usr/sbin/vzctl enter ' as root on vztest.

Does anyone know a workaround for this?

I know this already works with xen as we are already using this method. would be great to get it working with openvz aswell!

Any help is appreciated.
