

Hi,

This is my current attempt at getting the kmem controller into a mergeable state. IMHO, all the important bits are there, and it shouldn't change *that* much from now on. I am, however, expecting at least a couple more interactions before we sort all the edges out.

This series works for both the slub and the slab. One of my main goals was to make sure that the interfaces we are creating actually makes sense for both allocators.

I did some adaptations to the slab-specific patches, but the bulk of it comes from Suleiman's patches. I did the best to use his patches as-is where possible so to keep authorship information. When not possible, I tried to be fair and quote it in the commit message.

In this series, all existing caches are created per-memcg after its first hit. The main reason is, during discussions in the memory summit we came into agreement that the fragmentation problems that could arise from creating all of them are mitigated by the typically small quantity of caches in the system (order of a few megabytes total for sparsely used caches). The lazy creation from Suleiman is kept, although a bit modified. For instance, I now use a locked scheme instead of `cmpxchg` to make sure cache creation won't fail due to duplicates, which simplifies things by quite a bit.

The slub is a bit more complex than what I came up with in my slub-only series. The reason is we did not need to use the cache-selection logic in the allocator itself - it was done by the cache users. But since now we are lazy creating all caches, this is simply no longer doable.

I am leaving destruction of caches out of the series, although most of the infrastructure for that is here, since we did it in earlier series. This is basically because right now Kame is reworking it for user memcg, and I like the new proposed behavior a lot more. We all seemed to have agreed that reclaim is an interesting problem by itself, and is not included in this already too complicated series. Please note that this is still marked as experimental, so we have so room. A proper shrinker implementation is a hard requirement to take the kmem controller out of the experimental state.

I am also not including documentation, but it should only be a matter of merging what we already wrote in earlier series plus some additions.

Glauber Costa (19):

- slub: don't create a copy of the name string in kmem\_cache\_create
- slub: always get the cache from its page in kfree
- slab: rename gfpflags to allocflags
- slab: use obj\_size field of struct kmem\_cache when not debugging
- change defines to an enum
- don't force return value checking in res\_counter\_charge\_nofail
- kmem slab accounting basic infrastructure
- slab/slub: struct memcg\_params
- slub: consider a memcg parameter in kmem\_create\_cache
- slab: pass memcg parameter to kmem\_cache\_create
- slub: create duplicate cache
- slub: provide kmalloc\_no\_account
- slab: create duplicate cache
- slab: provide kmalloc\_no\_account
- kmem controller charge/uncharge infrastructure
- slub: charge allocation to a memcg
- slab: per-memcg accounting of slab caches
- memcg: disable kmem code when not in use.
- slub: create slabinfo file for memcg

Suleiman Souhlal (4):

- memcg: Make it possible to use the stock for more than one page.
- memcg: Reclaim when more than one page needed.
- memcg: Track all the memcg children of a kmem\_cache.
- memcg: Per-memcg memory.kmem.slabinfo file.

Subject: [PATCH 01/23] slub: don't create a copy of the name string in kmem\_cache\_create  
 Posted by [Glauber Costa](#) on Fri, 20 Apr 2012 21:48:58 GMT  
[View Forum Message](#) <> [Reply to Message](#)

---

When creating a cache, slub keeps a copy of the cache name through strdup. The slab however, doesn't do that. This means that everyone

registering caches have to keep a copy themselves anyway, since code needs to work on all allocators.

Having slab create a copy of it as well may very well be the right thing to do: but at this point, the callers are already there

My motivation for it comes from the kmem slab cache controller for memcg. Because we create duplicate caches, having a more consistent behavior here really helps.

I am sending the patch, however, more to probe on your opinion about it. If you guys agree, but don't want to merge it - since it is not fixing anything, nor improving any situation etc, I am more than happy to carry it in my series until it gets merged (fingers crossed).

A consistent name with slub saves us an accessor function.

In both caches, this field represents the same thing. We would like to use it from the mem\_cgroup code.

Subject: [PATCH 05/23] memcg: Reclaim when more than one page needed.  
 Posted by [Glauber Costa](#) on Fri, 20 Apr 2012 21:49:02 GMT  
[View Forum Message](#) <> [Reply to Message](#)

---

From: Suleiman Souhlal <ssouhlal@FreeBSD.org>

mem\_cgroup\_do\_charge() was written before slab accounting, and expects three cases: being called for 1 page, being called for a stock of 32 pages, or being called for a hugepage. If we call for 2 pages (and several slabs used in process creation are such, at least with the debug options I had), it assumed it's being called for stock and just retried without reclaiming.

Fix that by passing down a minsize argument in addition to the csize.

And what to do about that (csiz == PAGE\_SIZE && ret) retry? If it's needed at all (and presumably is since it's there, perhaps to handle races), then it should be extended to more than PAGE\_SIZE, yet how far? And should there be a retry count limit, of what? For now retry up to COSTLY\_ORDER (as page\_alloc.c does), stay safe with a cond\_resched(), and make sure not to do it if \_\_GFP\_NORETRY.

Subject: [PATCH 06/23] slab: use obj\_size field of struct kmem\_cache when not debugging

Posted by [Glauber Costa](#) on Fri, 20 Apr 2012 21:49:03 GMT

[View Forum Message](#) <> [Reply to Message](#)

---

The kmem controller needs to keep track of the object size of a cache so it can later on create a per-memcg duplicate. Logic to keep track of that already exists, but it is only enable while debugging.

This patch makes it also available when the kmem controller code is compiled in.

I am sorry.

My mail server seems to be going crazy in the middle of the submission,  
and the whole patchset is not going through (and a part of it got  
duplicated)

I'll post the whole series later, when I figure out what's wrong.

Thanks a lot for doing this.

I actually noticed that, at least for slab, the cmpxchg could never fail due to kmem\_cache\_create() already making sure that duplicate caches could not be created at the same time, while holding cache\_mutex\_mutex.

I do like your simplification though.

We will have to be careful for cache destruction.

I found several races between allocation and destruction, in my patchset.

I think we should consider doing the uncharging of kmem when  
destroying a memcg in `mem_cgroup_destroy()` instead of in  
`pre_destroy()`, because it's still possible that there are threads in  
the cgroup while `pre_destroy()` is being called (or for threads to be  
moved into the cgroup).

I found some problems here as well.

I am trying to work on top of what Kamezawa posted for `pre_destroy()`  
rework. I have one or two incorrect uncharging issues to solve, that's  
actually what is holding me for posting a new version.

expected soon
