Hello, we are running the 2.6.18-274.7.1.el5.028stab095.1 kernel but we seem to be getting really slow download speeds inside containers. On the HN we get great speeds, I have iotop but I don't quite know what I am looking for to see if the drives are being bottle necked. Do you have any ideas?

I think you need to provide more information so that other ppl can help you further such as /proc/user_beancounters, iptables setting in HW & container
