Hello

I'm trying install a Proxmox 2.1 from USB

I follow the guide:

http://pve.proxmox.com/wiki/Install_from_USB_Stick, making the USB bootable on Windows.

I don't get any errors on this.

But when I want to boot from pendrive, I get : "isolinux.bin is missing or corrupt" when boot from pendrive

I try on another Windows, from linux, and now, with UnetBootIn

My mother is a Intel D865PERL, (is my home machine). Could be compatibility problem?
