Hello there,

actually we are a web hosting company which need to start VPS bussiness

we will use OpenVZ for virtualization

but we need to know how we could configure VPS in order to prevent any VPS from abusing the HN (Hardware Node) resources

off course we will monitor the VPS but at the mean time we couldnt gurauntee that we will be infront of the HN 24 hourse a day

so, we need a solution which will ensure that no VPS will abuse the main HN resources & so willnt abuse other VPS customers

any help will be apretiated

please accept my best regards

You can set the UBC parameters to limit its resources such as RAM, disk space

For your reference:

wiki.openvz.org/UBC_parameters

wiki.openvz.org/UBC_primary_parameters

wiki.openvz.org/UBC_secondary_parameters

wiki.openvz.org/UBC_auxiliary_parameters
