Subject: CentOS 5 HN with CentOS 6 Container Issues

Hello there,

I am having an issue with any CentOS 6 container, and I am hoping I have simply just overlooked something. The HN runs CentOS 5 x64. When I create a CentOS 6 container, it works until I try to install cPanel. cPanel on the 64bit container will not start the web server using DSO, however, it will run the other php handlers. cPanel on CentOS 6 32bit, does not even install the web server, and will not fully install.

Has anyone else come across these issues? Have I overlooked something?

Kernel - 2.6.18-308.el5.028stab099.3
HN - CentOS release 5.8 (Final)

I do have cPanel installed and running just fine on a CentOS 5 64bit container.

Any help is appreciated, as I have been pulling my hair out on this!

Regards,
Chris
