I see the message 'proc: unrecognized mount option "relatime" or missing value', when I upload Kernel to RHEL6 042stab055.10.

I have never seen with Kernel RHEL6 042stab044.11.

Why does this message appear?

I only know it appears when a container stops.

This is probably printed by some container having very old utilities, and if you do not see any other manifestation of the problem, you can safely ignore that.

I saw this also

tested on 2.6.32-042stab056.2

ploop 1.2-1

it happens when CT is in ploop and when you stop CT

don't know does it have any side effect...

do you need bug report or it's just some harmless message?

in dmesg:

```
[ 632.466904] EXT4-fs (ploop0p1): Unrecognized mount option "relatime" or missing value
```

```
[ 632.476950] proc: unrecognized mount option "relatime" or missing value
```

hm, normally (/dev/proc/sys|...) doesn't mounts with this option

inside CT:

#mount

/dev/ploop0p1 on / type ext4 (rw,relatime,barrier=1,data=ordered,balloon_ino=12)

proc on /proc type proc (rw,relatime)

sysfs on /sys type sysfs (rw,relatime)

none on /dev type tmpfs (rw,relatime,mode=755)

none on /dev/pts type devpts (rw,relatime,gid=5,mode=620,ptmxmode=000)

none on /proc/sys/fs/binfmt_misc type binfmt_misc (rw,relatime)

Thank you for answering.

I am going to ignore it.

I don't have any containers running ploop and I just started seeing it on 2.6.18-308.8.2.el5.028stab101.1 which is the latest el5 kernel as of the time of this post.
