Hi,

I have a confusion.

I'm creating a OpenVZ container (for cPanel/WHM VPS)

Datacenter provided 5 IPs (1.2.3.26-30)

- IP Range - 1.2.3.26-30

- Netmask - 255.255.255.248

- Gateway - 1.2.3.25

i'm using Proxmox control panel at - 1.2.3.26:8006

When i create OpenVZ container, Routed mode (venet) IPaddress , i provide 1.2.3.27,

In the DNS server 1, i provide 1.2.3.27 (Can share the main IP of the vps??)

In the DNS server 2, i provide 1.2.3.28

Main query is as above, Can i share the Main IP of the VPS with its DNS server 1 IP ?

OR create 2 nameservers using 2 IPs and share it among all VPS? how?

Thanks,
