I barely remember there was a fix in the kernel related to this. I might be wrong, but it's worth checking on a latest rhel6 stable or testing kernel.

Indeed, I did a search on wiki.openvz.org for vmstat and found this:

<http://wiki.openvz.org/Download/kernel/rhel6/042stab057.1>

[fairsched] vmstat floating point operation fixed: idle scaling has been enhanced once again (PCLIN-30773)

I guess that's what you are reporting. Please update your kernel.
