Subject: Access to /proc/drbd inside a container

---

I've configured drbd inside a pair of containers. The drbd module is loaded on the host node, and I've granted access to the raw device nodes (dm-1 and dm-2) to the containers. Running drbdadm create-md resource inside the container works, so the container has access to the dm devices.

The problem is that bringing the resources up complains that the module is not loaded. Also, there is no /proc/drbd inside the container (there is on the host node)

I've seen other posts from folks that report having access /proc/drbd inside the container, so I think I must be missing something.

Any ideas on how to be able to see the loaded module from inside the container??

Thanks in advance.

sean
