Hi,

I am looking for this openvz kernel ebuild for gentoo:

https://bugs.gentoo.org/show_bug.cgi?id=427286

Any idea where it is?

It builds this openvz kernel:

http://wiki.openvz.org/Download/kernel/rhel6/042stab057.1

Best,

"In July 2005, after several failed attempts to legalise software
patents in Europe, the patent establishment changed its strategy.
Instead of explicitly seeking to sanction the patentability of
software, they are now seeking to create a central European patent
court, which would establish and enforce patentability rules in their
favor, without any possibility of correction by competing courts or
democratically elected legislators."

so 042stab057.1 is outdated, maybe you want to go with 042stab059.7.
I can't provide you an ebuild, because i don't use Gentoo, but i give
you a hint.

I got the same problems on ArchLinux on my work to provide an openvz

package for this distro. After many weeks of research i found the
problem, you need to use gcc 4.4.x! There is also an bugreport [0] for that.

I run sucessfully stable [1] and testing [2] kernels on an ArchLinux
systems, maybe you want merge some stuff in your ebuild.

[0] <http://bugzilla.openvz.org/show_bug.cgi?id=2012>
[1] <https://aur.archlinux.org/packages.php?ID=57949>
[2] <https://aur.archlinux.org/packages.php?ID=59094>

regards,
Lucky

Is it similar to this crash?:

 http://mirrors.ch3rry.be/openvz/kernel-genkernel-x86_64-2.6. 32-openvz-057_crashlog.jpg

I will try now with gcc4.4 to see if I have a different result...
