Subject: 2 GW, 2 Subnets, 1 NIC
Posted by fenta on Fri, 31 Aug 2012 13:21:46 GMT

Hey there.

First of all, sorry for my bad englisch, i'm giving my best. I'm from austria.

I have a dedicated server in a datacenter with 2 IP subnets (/28), i'm hosting some VPS with openvz on it.

I've entered all the infos for the first subnet into the ifcfg-eth0, but how can i enable the second subnet? It has a different gateway. All things i found via google is to create a ifcfg-eth0:0, but then i will lose 1 ip for the host?

Do you have a idea?

Best regards.
