
Subject: IO accounting auxiliary info on RHEL6 kernel

Hi,

I'm searching for IO accounting information per container via the
/proc/bc/\$VEID/ioacct entry.

The IO Accounting wiki page states some auxiliary information, such as sync,
read, and write counts are included within the IO activity – however I am not
seeing this auxiliary information at all on any RHEL6 kernels.

Has the aux. info. been not included or removed past RHEL5? Is there any way to
access this info as described in the current RHEL6 testing/stable kernels?

Regards,

Bryon
