
Subject: Dell Dimension 4300 - NIC module dmfe missing

Installed on an existing FC4 Hardware Host. When booting into the openvz kernel I get an error message when it tries to bring up the network.

My stock FC4 kernel loads the dmfe module for the NIC:

(from /etc/modprobe.conf)

alias eth0 dmfe

lspci | grep Ethernet

02:09.0 Ethernet controller: Davicom Semiconductor, Inc. 21x4x DEC-Tulip compatible 10/100

Ethernet (rev 31)

Stock kernel has

/lib/modules/2.6.14-1.1644_FC4/kernel/drivers/net/tulip/dmfe .ko while it is missing from openvz kernel.

I know that OpenVZ has many drivers compiled into the kernel rather than as modules but this doesn't seem to be the case for this NIC.

I'd attempt to compile my own kernel but given the complexity of the process, I'm wondering if there is a technical reason it is missing... or if it can eventually be incorporated into OpenVZ stable kernel??

I got OpenVZ working on another machine just fine (with the exception of the sound device)... and am really impressed.

A little more info:

In dmesg of stock kernel:

eth0: Davicom DM9102 at pci0000:02:09.0, 00:80:ad:78:c4:ff, irq 11

[...]

dmfe: Davicom DM9xxx net driver, version 1.36.4 (2002-01-17)

From Virtuozzo Hardware Compatibility page:

<http://www.virtuozzo.com/en/products/virtuozzo/hcl/network/>

Davicom DM9102/DM9102A 21x4x DEC-Tulip compatible 10/100 Ethernet Adapter 0x9100

So, perhaps I'm doing something wrong? Suggestions?

I loaded the tulip module by hand and it did bring up the interface, but it didn't work. I could ping IP addresses (not names although resolv.conf is fine) but no application protocols seemed to work. Lost on this one.

What is the version of OpenVZ kernel you are using?

Hello Dowdie,

we support this hardware by tulip driver.

you need to replace alias in /etc/modprobe.conf
alias eth0 tulip

I hope it resolves this issue.

If you want we can add the compilation of dmfe module into our next kernels. Could you please confirm that you really need it and you are able to test it.

thank you,
Vasily Averin

The kernel I'm using the latest/greatest (at time of writing):
2.6.8-022stab050.1

Ok, followed your advice and tulip driver seems to be working... especially since I turned off iptables on the hardware host.

Thanks for your assistance.

As for iptables, the reason is stateful rules - you need to remove them from config (/etc/sysconfig/iptables). Quoting the FAQ:

Quote:Q. My node is inaccessible through the network after reboot...

A. You need to check your firewall rules. The problem is that default stateful firewall rules are not available on the host system. To make this functionality available, load the ip_conntrack module with the additional parameter "ip_conntrack_enable_ve0=1". However, this method is highly not recommended because tracking all the connection on the host system lead to performance degradation, more memory usage and also may lead to the total server inaccessibility due to reaching of the overall connection limit.
