
Subject: [RFC PATCH v2] posix timers: allocate timer id per task
Posted by [Stanislav Kinsbursky](#) on Wed, 17 Oct 2012 13:17:41 GMT
[View Forum Message](#) <> [Reply to Message](#)

v2:

1) Hash table become RCU-friendly. Hash table search now done under RCU lock protection.

I've tested scalability on KVM with 4 CPU. The testing environment was build of 10 processes, each had 512 posix timers running (SIGSEV_NONE) and was calling timer_gettime() in loop. With all this stuff being running, I was measuring time of calling of syscall timer_gettime() 10000 times.

Without this patch: ~7ms

With this patch : ~7ms

This patch is required CRIU project (www.criu.org).

To migrate processes with posix timers we have to make sure, that we can restore posix timer with proper id.

Currently, this is not true, because timer ids are allocated globally.

So, this is precursor patch and it's purpose is make posix timer id to be allocated per task.

Patch replaces global IDR with global hash table for posix timers and makes timer ids unique not globally, but per task. Next free timer id is type of integer and stored on signal struct (posix_timer_id). If free timer id reaches negative value on timer creation, it will be dropped to zero and -EAGAIN will be returned to user.

Hash table is size of page (4KB).

Key is constructed as follows:

key = hash_ptr(current->signal) ^ hash_32(posix_timer_id);

```

This is quite expensive on 64 bit arches. I suggest instead :

```
return hash_32(hash32_ptr(sig) ^ nr, POSIX_TIMERS_HASH_BITS);
```

Hmm...

```

> +}
> +

```

You probably need to add a `rcu_assign_pointer()` or `smp_wmb()` before the :

```
new_timer->it_signal = current->signal;
```

in the following block :

```

spin_lock_irq(&current->siglock);
new_timer->it_signal = current->signal;
list_add(&new_timer->list, &current->signal->posix_timers);
spin_unlock_irq(&current->siglock);

```

Or else another thread can read outdated informations...

```

spin_lock_irq(&current->siglock);
list_add(&new_timer->list, &current->signal->posix_timers);
spin_unlock_irq(&current->siglock);
smp_wmb();
new_timer->it_signal = current->signal;

```

I'm not familiar with hashing costs, so sure, I'll update.

Sorry, but I don't understand what races you are talking about.
Could you specify, please?
