hi there,

maybe someone has hints on this one: i tried to stop one of my VPS using: vzctl stop VPSID

however, i get:

```
[root@vsrv ~]# vzctl --verbose stop 17
Unable to open /usr/lib/vzctl/modules/: No such file or directory
Stopping VPS ...
Unable to stop VPS, operation timed out
```

all processes are killed, the veth device is removed, but the vps is still up so i can neither stop nor restart it.

i'm at a loss here ...

thanks,  
marc

Can you strace vzctl, please?  
strace -f -o strace.out vzctl stop 17  
And attach strace.out file here.

Thanks.

Well, what we can see... While stoping VE:

```
.....
    ret = real_env_stop(h, veid, root, stop_mode);
.....
for (i = 0; i < MAX_SHTD_TM; i++) {
    sleep(1);
    if (!vps_is_run(h, veid)) {
        ret = 0;
        goto out;
    }
}
```

real\_env\_stop() function just invokes "halt" in VE...  
Do you have halt in VE? BTW, what template do you use?  
You can try to stop VE be specifying --fast option:  
vzctl stop <VEID> --fast  
then vzctl won't execute halt, it just try to kill VE's init.

hi,

i used the standard debian 3.1 template, as downloaded from [openvz.org](http://openvz.org); the vps contains "halt".

what happens is that i execute vzctl stop XX, and vzctl timeouts. it does kill most of the processes (just leaving 3 running, other times it kills all of them). for example, vzlist shows:

17	0 running	vsrv17
----	-----------	--------

the --fast option didn't help either

Looks like something bad...

What kernel version, host OS do you use?

Can you provide temporary access to the node in question?

Thanks.

hi,

this is CentOS release 4.3 (Final) with kernel 2.6.16-026test017.1-smp (rpm from openvz)  
remote access is unfortunately impossible since this is behind a firewall, using internal ips.  
i'm using veth

i found something else in "dmesg":

unregister\_netdevice: waiting for lo to become free. Usage count = 4267

(lots of those messages, that is)

apparently something in networking causes these hangs. interestingly, when i run network-related commands like "ifconfig" or "ip addr show" in any VPS node AND in the hardware node, it hangs. other commands run just fine.

reminds me of a test kernel some months ago, where the entire system would crash after "vzctl stop" if the veth device wasn't manually shut down and removed before.

Seems to be bug... Can you fill bug in [bugzilla.openvz.org](http://bugzilla.openvz.org), please.

Kenel version, architecture, dmesg messages, etc..

Thank you very much!

Hello

I think This error is due to backup (with option --suspend) or something locking on this virtual machine
