Well, i have no idea whys the server dont start, tryed each godamn howto i could find, still nothing,

tested precompiled AND source

have someone else had the problem that they could get it to work ?

please provide more info.. like: what doesn't start, kernel version, ovz utilities versions, error
messages - anything helpful

problem is that it is on a remote computer so i cant check the errors neither, the kernel version is
2.6.8 (dl'ed from kernel.org)

Sounds like you don't have an OpenVZ kernel on the remote computer. That will never work.

You need to get OpenVZ working on a local machine, where you can see what you're doing,
before attempting to walk the high wire without a net.
