Hello,

If I am not mistaken, ipset modules are included into kernel as a standard since version 2.6.39. As far as I know, OpenVZ doesn't support ipset in containers.

Are there plans to support it?

Thanks.

I assume the answer is "no".

However it would be interesting to learn why "no". AFAIK, every container has its own netfilter rules. What are the fundamental obstacles preventing implementing per-container ipsets?

There's no mention of ipsets in Wiki, as well.

Thanks.
