**Subject: centos 6.4 and vswap problem**
Posted by blackmetal on Wed, 08 May 2013 05:24:35 GMT

Hello,
in centos 5 when you create container and login to container and execute free -m it shows burstable memory but in centos 6.4 when you create vm and login to container and execute free -m it shows guaranteed memory , how can i fix this issue which show burstable memroy or vswap memory size instead guaranteed memory ?
thanks,

Within containers that use vswap, free -m shows virtual swap and regular memory, separated. Pretty much the same as a bare metal server would.

Example from a vswap enabled container:

```
                total      used      free     shared    buffers    cached
Mem:            2048       866       1181        0         0        740
-/+ buffers/cache:         126      1921
Swap:           2048         8       2039
```

Could you please post examples of the free -m output on your servers (and what you expect to see)?
