Subject: Zimbra on OpenVZ container: Disk space Issues

Hi,

After installing zimbra multi-server setup on openvz containers, I realized that when zimbra services are runing, the size of the diskspace increases whenever i execute `df -h` until it reaches 100%.

Am runing centos-6.4-x86_64 with openvz-2.6.32-042stab076.8.

I verified that this happens on both ploop and simfs.

Any help will be appreciated.

Thanks.

Did you check what consumes the space? My first hunch is to look at the log files... or you could just search for all very large files.

Hi,

Followd your lead and found out zimbra was logging huge amount of warning or notice info to the logs.

Problem solved.

Thanks.
