Recently, I've been in need of a control panel for OpenVZ, in which there are the following levels of usage:
- Top level (administration - manage VPS')
- Bottom level (customer/user - manage their VPS alone)

Seems I'm not the only one with this need. After completing a previous control panel, and tweaking OpenVZ around, I've decided to make a modified version of OpenVZ, that comes along with it's own control panel, and some more user friendly command line tools (like a wizard-like VPS manager, etc.)

Also, the project will have an eCommerce side, using the popular web site "PayPal" (www.paypal.com) for transactions.

Deep down low, this should turn out to be an ideal way to sell VPS' over the Internet to customers without having to build your own control panel.

Any ideas, thoughts?

Jonathon

We have a lot experience in configuration products for e-commerce. For example we have a project X-Cart, LiteCommerce & SnS. And we are interested in your project. We can help you in development of such a modules for PayPal and of course we can wrote an java-application, or use an AJAX module for SSH-connections or something.
