I am trying to use the Slackware 13.37 minimal x86_64 template from the contributed section of the precreated templates page. After installation, I get the error "Container config file not found" in the serial console. Does anyone know what is wrong? Please tell me if you need more info.

Please post details of your system:
- which is your host OS and version
- what vzkernel and vztools version are you using.

And:
- what command did you use to create the VM
- what command are you starting the VM with.

The VM was provided through SolusVM, so I can't say the exact command. However I'd assume it is just a standard vzctl create.

The node is using RHEL6 (centos 6) with newest kernel.

Well, I see no other way to solve this then to troubleshoot.

Try to replicate the issue using plain vzctl. Create a fresh container from the template in question and start it up, then please post any errors you might encounter, with corresponding commands used.

Seems like for some reason it deletes the container config file. Is there any log file that would say why?

I recommend you contact with solusVM and report findings and results here.
