Hello,

I migrated 3 containers from proxmox 2.6 to proxmox 3.0. Everything went well however I have problems with iptables. I noticed that the container couldn't send email, so I checked the logs and saw it couldn't reach the smtp server. Ping was also not possible. Once I flushed iptables I am able to contact everything as normal, however this isn't a good solution. Does anyone know how this could have happened? The IP/DNS stayed the same, it's only the host that has changed.

Thanks in advance

Regards  
Mike

first of all it's not a proxmox support community.  
but it is not clear what kernel version and openvz tools you are using?  
what OS you are using in HN and in CTs?  
where did you flush iptables rules?  
is this HN or CT?  
what exactly iptables rules are (before flushing)?  
what network setup is?

I did the same upgrade without any problems. In both cases I had configured the networking with shorewall. My containers don't have public IPs. They access the internet through NAT.
