[View Forum Message](#) <> [Reply to Message](#)

Hi, my test server running 2.6.16 with patch 2.6.16-026test018.1 has crashed twice, both times with this in the messages file:

crash #1:

Sep 27 17:00:29 server kernel: Fatal resource shortage: kmemsize, UB 0.

[DEAD]

crash #2:

Sep 28 03:00:37 server kernel: Fatal resource shortage: kmemsize, UB 0.

Sep 28 03:05:54 server last message repeated 4 times

Sep 28 03:05:54 server kernel: Unable to load interpreter /lib/ld-linux.so.2

[DEAD]

For the second one, I managed to get a screen capture of the console but its only the end of the panic, I am not sure if it helps any.

Have I presented any information to figure out what the problem is?

Harold

Sorry, I don't understand what kernel version do you use...

To get 2.6.16 OpenVZ kernel you should use patch-026test* kernel,
not patch-022stab*. patch-022stab is for 2.6.8 kernel.

So, waiting for comments,

Thanks.

What was the config for kernel?

Can you post it here?

When crash happens: during boot, or after some time work?

What is your architecture?

Can you give `lspci` and `lspci -n` on the node.

Thanks!

Quote:When crash happens: during boot, or after some time work?

After 3-6 hours of hard work.

Hello, this is known bug. It appeared after some UBC optimization. Will be fixed soon!
Will you file bug in bugzilla?

PLEASE, can you set up serial console to get FULL call trace?

Thanks!

Try this patch

<http://git.openvz.org/?p=linux-2.6-openvz;a=commit;h=4165f1fa371b60cb3a225910faebde95650a1f65>
at the top of 026test018.1

This should help with resource shortage, but not OOPs
