Hi All,
I have moved a container from 2.6.32-4-pve (Proxmox 1. via vzdump. I restored it on a new Debian with kernel 2.6.32-openvz-042stab084.12-amd64.

The problem is that interface venet 0:0 is not coming up at boot and working after network restart. Also The syslog is not starting and all the other services are failed to start. nothing is written to the syslog.

Also its not possible to stop the container there are a lot of defunct processes.
I have created a new container with the same template and it looks fine.

Anyone have an idea?

Thanks
David

SOLVED,,, I have restored the dump on proxmox 2.3 vzdumped it and restore on the OVZ kernel,

All is working,
