Some beancounter software tells me that numiptent should not be greater than 200-300!

Mine is 4000

What is an optimal value, and mainly why should not be greater than 300?

Quote: Also, large numiptent cause considerable slowdown of processing of network packets. It is not recommended to allow containers to create more than 200300 numiptent.

Is it too dramatic when i keep 4000?
