I've been having some issues trying to make a container. I've searched google but have found no working answer.

Internal error: Command 'vzctl create 1 --ostemplate centos-6-x86_64 --config vswap-256m' execution failed with code 151

Output: Creating image: /vz/private/1.tmp/root.hdd/root.hdd size=2306867K

Creating delta /vz/private/1.tmp/root.hdd/root.hdd bs=2048 size=4614144 sectors v2

Storing /vz/private/1.tmp/root.hdd/DiskDescriptor.xml

Error in check_mount_restrictions (ploop.c:1358): The ploop image can not be used on ext3 or ext4 file system without extents

Failed to create image: Error in check_mount_restrictions (ploop.c:1358): The ploop image can not be used on ext3 or ext4 file system without extents [21]

Destroying container private area: /vz/private/1

Creation of container private area failed

I haven't seen this problem before, so I can just try to ask some additional questions and perhaps help you find something you didn't think of yet:

- on the node: which OS, os version, kernel version, openvz version?
 - are you using ext3 or ext4?
 - is this an old extN file system that has been upgraded to the current one?
 - are extents disabled for some reason?
 - any other special circumstances about your storage - is it a straight HW device, or some kind of shared, virtual, remote storage, etc.?
-
